Abstract—The paper presents a hands-on tutorial to develop a robust near real-time high volume sensor data acquisition and analysis framework. The hardware used in this tutorial are based on open-source platforms like Arduino and Raspberry-Pi Single Board Computer. The framework has been developed at RBCCPS, IISc Bangalore. The framework consists of 1) a model network architecture, 2) hardware 3) software micro-services to provide data storage, aggregation, and stream processing. The framework is currently being used at RBCCPS to acquire data remotely from an Surface Mount Technology (SMT) circuit board soldering assembly line which is situated about 150Km from our research facility. The volume of data collected daily varies from 5GB to 15GB. The framework uses software modules based on python, ruby and nodejs. Other software tools used include Mosquitto MQTT Broker, Norikra stream processor, node HTTP proxy server, Elasticsearch timeseries database for storage, Kibana and Freeboard for data visualisation and annotation of data.

I. INTRODUCTION

THIS demo file is intended to serve as a “starter file” for IEEE journal papers produced under L^AT_EX using IEEEtran.cls version 1.8b and later. I wish you the best of success.
